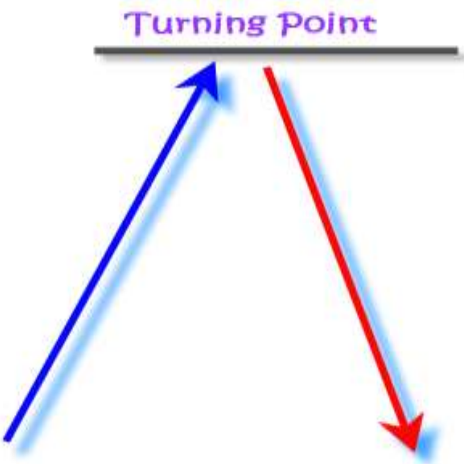
7 Great Simple-N-Easy ways to find Turning Points in the Forex market



7 Great Simple-N-Easy ways to find TURNING POINTS in the Forex Market

INDEX

Introduction

This series shows Simple-N-Easy techniques to achieve Forex trading objectives. As this series uses a simple approach to these techniques, we give enough detail about the techniques for you to understand the concept the techniques are based on.

How we trade these techniques and which setting to use can vary as market conditions vary. In terms of techniques we give you basic settings. It is up to you to start trading the method and find the type of setting and approaches which will best suit your personal trading needs. Forex trading is a practical skill such as swimming. We do not cover every aspect about Forex trading in this module as this module is only one of a 20+ series of modules on Forex trading. You can not learn to swim from an eBook or video – You need to trade the market and let it teach you how it wants to be traded. So we strongly encourage you to experiment and try all the concepts shown in this module.

Turning points are a lot easier to spot than many people believe. To trade turning points takes experience, psychological and trading skills. This series will introduce you to the turning point concepts which will allow you to invest your trading time in the most economical way.

More information will be provided on specific items and techniques in other modules e.g. where to place stops, where to exit, support and resistance etc. If you need more information in the meantime try Google search facilities for YouTube. You can find articles and videos on almost any Forex trading topic.

Trading turning points refers to any time the price trends in a specific direction and then clearly changes direction and trends in the other direction. This is often referred to retractment, retracement, bounce or turning point trading. We treat these terms as meaning the same in this book.

What Moves the Market?

Market movements are determined by the buy and sell order flow into the market – it is as simple as that. You therefore have to become an expert at understanding how the market responds to these sell and buy orders and where they are likely to accumulate.

There are 4 groups of orders.

Group 1: The Big Forex Market participants: Your worst enemy

This group consist of big players in the market who have the ability to move the market. You better believe this for your own trading sanity. How often have you been in a transaction which is going nicely positive for an hour or so and then suddenly goes 30 to 50 pips against you for no apparent reason? There was no announcement. There was no major support or resistance where the price turned. It was not at a special time of day i.e. market opening. What just happened?

What just happened is that a big player did not like the direction of a particular market trend and then boldly introduced a huge amount of orders in the opposite direction. Because the price is in the middle of nowhere these orders have an overwhelming impact and will reverse the market. They have very little risk as their deal goes profitable almost immediately. This happens 6 to 8 times a day and explains why in spite of following your trading plan to the letter your deal went bad.

We will see examples of these turning points, particularly when discussing volume techniques.

Group 2: Market behaviour based on support and resistance

The second group are orders placed by participants in the market based on Technical Analysis approaches (mainly support and resistance). These orders are placed at various strategic price levels and act as entry orders or stop orders. These orders accumulate around support and resistance levels in the market. This explains why when a certain price level is reached there is often a big move in the market as all these orders are activated at the same time. You need to be quite good at identifying these support and resistance levels so that you can anticipate these moves. A large part of the market movement is based on these price levels.

Group 3: Fear and Greed orders

These are orders that are placed in the market as a result of economic announcements and news. These kind of orders can move the market over 100 pips in 2 minutes and can also reverse the market over 200 pips in the next 5 minutes. They are orders that are placed as a result of the fear and greed reactions to current news. You need to watch the economic announcements schedule closely to make sure you are not adversely affected by these orders. When in doubt don't trade.

Group 4: Orders based on normal commercial and investment processes

These orders are processed by the financial institutions based on their actual need to buy and sell currencies in order to settle commercial trade transactions or investment money movement transactions. Many times these transactions occur when financial markets open and when they are about to close. This is why trends can occur at these times.

We will see examples of this in the time of day concept.

So why try to spot and trade turning points?

They are not difficult to spot or anticipate.

Given the above points, these turning points should be easier to spot. They will occur when there is a huge unexplained volume increase in the market, near announcements, at the opening and closing of markets and at bounce or breakouts of support & resistance levels.

Best Risk return ratios

They offer the best returns on your risk. This means that if you get this part of your trading right your average stop will only be between 20 to 40 pips and your targets can be 60 to 300 pips

Best traders trade retracement trades

The most successful Forex traders we know are traders who trade retracements in the market.

EXAMPLE 1

In his interview with Mark Weinstein in his book Market Wizards Jack Schwager asks:
Schwager: Since 1980 what was the worst drawdown you have ever experienced?
Wienstein: I lose so infrequently that I don't keep track of that type of number
Schwager: What has been your worst losing month?
Weinstein: I haven't had any losing months
Schwager: Do you remember your worst losing week?
Weinstein: I haven't had any losing weeks during that time.
Schwager: Is there anything you can single out as the most important element in deciding to put on a trade?
Weinstein: I always look for a market that is losing momentum and then go the other way.

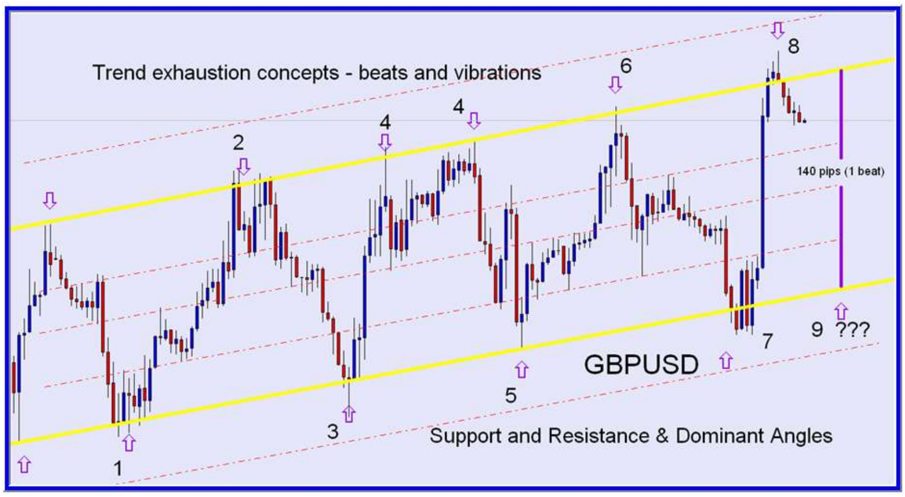
Example 2

In our recent analysis of a successful signal provider's trades we discovered that the prime way he enters a trade is by trading directly against the trend. The trader has now had no less than 501 trades without a loss (December 2010).

Only way of catching 95% to 100% on a trend

There are many forex trading techniques out there. Most are with the trend techniques that require 25% to 50% of the trend to identify it as a trend. Often a reversal of 25% to 50% of the trend is required to identify that the trend is over. Using the techniques that focus on identifying the turning points in the market is the only way you are going to end up catching between 85% to 95% of the trends. See the example below.

7 Great Simple-N-Easy ways to find Turning Points in the Forex market



General note on Turning Point trading

Turning point trading can produce bounces "to the pip" at very exact turning points. It is therefore important to **take your spread into account in all buy transactions**. Please bear in mind buy transactions can be buy entries. Stops and targets for sell entries are also effectively buy orders. You need to add the spread to buy transactions as charts generally use only sell values.

There are **2 approaches to trading turning points**. The one approach is to use the exact estimated turning point as your entry. This requires a degree of accuracy but can be done when using volume and support based principles.

The other approach is to wait for some sort of confirmation before committing to the bounce or turning point. Certain approaches force this as the confirmation occurs after the bounce has happened and not at the bounce. Using candle sticks is a good example of this. You can only enter after the bounce has happened and the spike or candle formation confirms that.

Both approaches have their merits – we would suggest that you use most of the approaches mentioned in this eBook and select the ones you are most comfortable with.

The Challenges with Trading Turning points

Psychological

There is something **scary** about standing on a railway track in front of an oncoming train. Many traders view the feeling of trading against the immediate oncoming trend the same as standing in front of the oncoming train. It is quite amazing to see the relief on the faces of forex traders new to this concept when they make a profit with their 1st transaction.

It takes a **paradigm shift** if you have not done this before but when you have experienced the low risk / return impact and the success ratio, you become addicted. It is a bit like being very scared of a wild roller coaster ride and then you just want to do it again after your first ride.

These types of transactions can fail. One of the biggest fears Forex Traders have about trading is the **fear of failure**. Some traders using some of these approaches have only a 40% success rate and yet they make huge amounts of money. This is so because they make twice or 3 times more on their winners than they lose on their losers. You need to know how to deal with losing if you are going to trade the forex market.

The concept goes against generally accepted trading "Sacred Cow" Forex trading and training concepts.

Expressions like "let the trend be your friend" make traders wary of trading directly against the trend. Against the trend techniques are generally not taught as often as with the trend techniques. This is because the trending techniques are seen as being easier and safer to teach to new traders.

The approach requires Good trading skills

Trading skills such as

- entering market orders
- identifying potential price formation turning points
- Entering within 40 seconds of a major volume spike
- Identifying reversal candle formations as they are forming
- Identifying support and resistance levels
- Placing stops were appropriate,

require experience and practice. They take an effort to master but like bicycle riding they soon become an automatic skill.

OK – let's move on to the 7 techniques to identify and trade turning points in the market:-

1 Trading Volumes

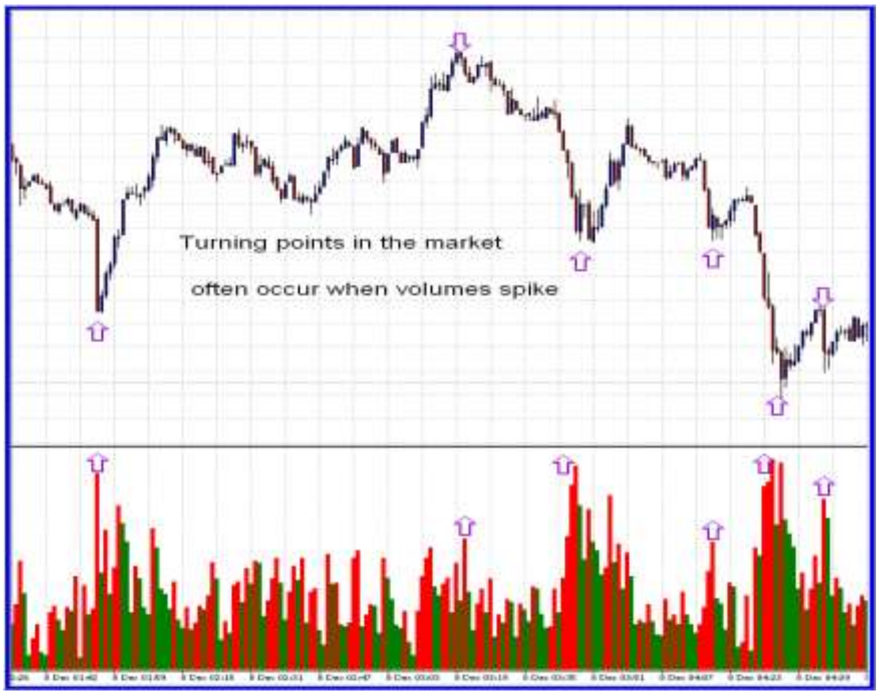
Remember the types of orders discussed previously. Group 1 were the Big Forex Market participants who could introduce large orders at anytime they wish. This can happen subtly 6 to 10 times a day. Using market volumes is the only way of catching these turning points.

You need to have the 1 minute chart open showing the volumes being traded. A huge increase in volumes (2 or 3 times the previous bars) while the price is trending can:-
1) Slow the trend down,
2) Stop it or
3) Cause it to reverse.

A huge increase in volume is likely to reverse the direction of the trend. See the example shown where the volume increase by 2 to 3 times the previous bar.

You would enter a transaction when you see this happens on the 1 minute chart. You will normally have 30 to 60 seconds to enter before the reversal actual happens, so your need to be quick! The chart below shows how this can happen a number of times within a few hours.

7 Great Simple-N-Easy ways to find Turning Points in the Forex market



Volume is available from most MetaTrader brokers and can be added to your charts using Insert > Indicators > Volume > Volume

This is an extreme example of a big player moving the market. Note the increase in trading volumes and the trend that developed.

On a smaller scale this happens every day. Back trade your trading charts using the 1 minute charts with volume loaded. You will be surprised.

Volume is actively also used in our With All the ODDS scalping techniques. See the details at the end of the book.

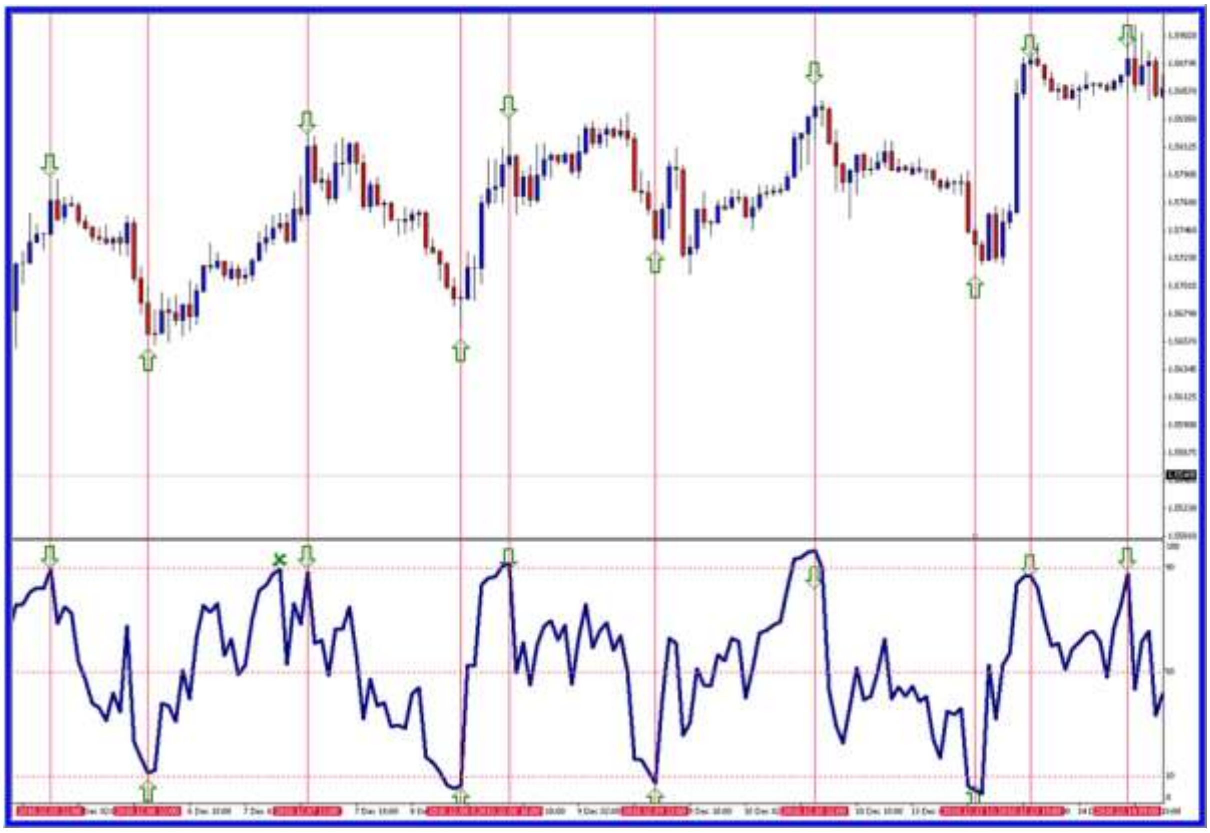
Basic techniques on How to trade turning points using Volumes

1. Set up your trading charts to the 1 minute time frame
2. Load the volume indicator
3. Trade in the opposite way when there is a trend and at the same time a sharp increase in volume. This has to be done within 30 to 60 seconds of the sharp increase (twice to 3 times the recent volumes)
4. Use 14 to 20 pips for your stop loss to start with and refine later based on your experience
5. The sharp increase in volume should reverse or stop the trend
6. Refine this technique as your experience increases.

2 Using Momentum signals

Generally momentum shows you how much the price is trading away from (deviating from) the general trend in the market. The general trend in the market is the middle line of the momentum indicator (the 50 line in the example below). When the momentum reading is above the middle line it is in a buy mode and below the middle line it is in a sell mode. When the momentum reading is in an exceptionally high or low area, the price is trading a long way from the general trend in the market. These exceptional readings can not be sustained and often result in turning points. This is based on a concept of price exhaustion. In practice these are levels of profit taking or where the bulls or bears run out of money to sustain the trend.

Below is an example of where the momentum indicator gave quite accurate turning signal warnings. We used an RSI indicator (Relative strength indicator) with a setting of 4 and lines at the 10, 50 and 90 levels.



2. Rules for using this approach.

1 You have to use this approach in a sideways moving market.
2 You have to use this approach in a sideways moving market
3 Always use a stop loss which is generally the same size as your expected gain. You can use the previous trend as a guide for your gain size.
4 Treat these as high risk trades.
5 Repetition of points 1 and 2 is intentional.

A sideways moving market is where the price is not making major new highs or lows that are much higher or lower than the previous ones. The above chart is an example of a sideways moving market. The chart to the right is an example of when the market starts trending.

The market moves sideways or gently trends 80% of the time. An aggressive way of trading these trades would be to trade immediately when the momentum reading goes above 90 to 95 or when is goes below 10 to 5.

More information on lower risk momentum trading is available in the Expert4x Magic Momentum course (see below for details) and the Momentum Module of this series to be published at a future date.

Basic technique on How to trade turning points using Momentum

1. Load the RSI indicator on your selected timeframe (Can be used on all time frames)
2. Ensure that the market is trading sideways and not trending
3. Trade in a reasonable volatile time of day (See time of day module)
4. Trade in the opposite direction of the prevailing trend once the indicator has gone further than the 90 or 10 levels AND then returns to the 70 or 30 levels. In other words, only trade once the RSI indicator has returned or reversed from these highly over bought or over sold conditions.
5. Enter stops and targets appropriate to your currency, timeframe and time of day
6. Exit when you receive a signal in the opposite direction of your trade or when the indicator returns over the 50 line.
7. Amend this approach based on your own experience.

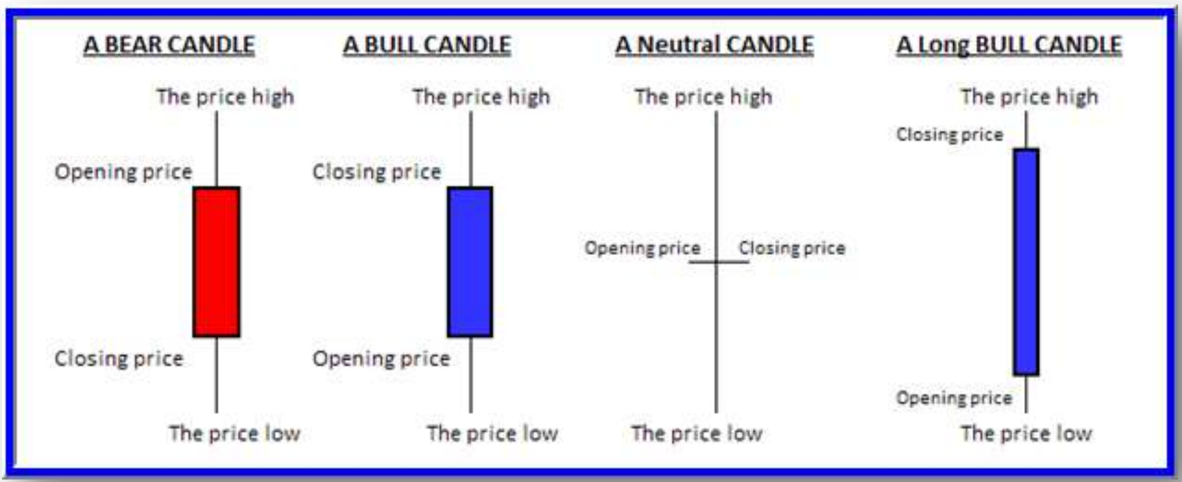
3 Using Candle stick formations

Most Forex traders use charts setup as candle charts. Candles give so much information at a glance. Japanese candles give a good visual summary of the path the price took during the single (one) time span of the chart.

If we say that we are using a 1 hour chart this means that every candle on the chart represents the price movement the price took during that 1 hour. A 1 hour candle would therefore equal the movement of the 12 five minute candles that can be found on the 5 minute chart.

The key information obtained from every candle is; the price high, the price low, the opening price, the closing price and the direction of movement from its colour.

The area between the opening and closing price is the body of the candle and represents the actual gains or losses made by the BEARS or the BULLS. If the price goes up (the BULLS have made gains) during the period of the candle, the body is normally blue. When the price goes down (the BEARS have made gains) the colour is normally red. When the opening price is equal to the closing price there is no body. If the BULLS or the BEARS make BIG gains during the period of the candle you get a LONG Candle.

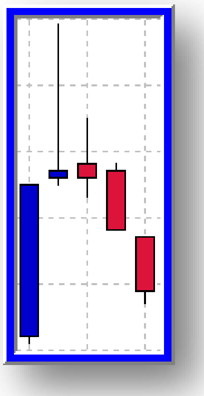


Trends are easy to see due the BULL and BEAR coloured candles. They give a good representation of the battle between the BULLS and the BEARS during every period of the chart. Historic breakout points and bounce points are easy to see and are normally represented by Long candles.

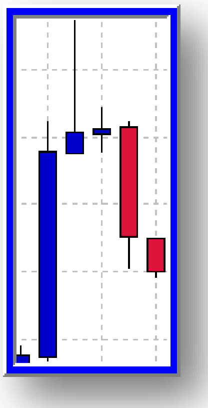
The most important reversal candle formations are spikes (thin long candle wick) and railway tracks (2 candles going in opposite directions at the end on a trend)

7 Great Simple-N-Easy ways to find Turning Points in the Forex market

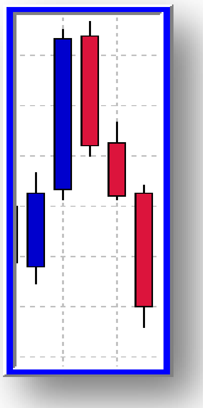
Bearish spikes show that the BULLS where nicely in charge and suddenly powerful BEAR orders not only stopped their progress but reversed the trend completely. One of the strongest market intervention moves you can find. The opposite applies to bullish spikes and railway tracks.



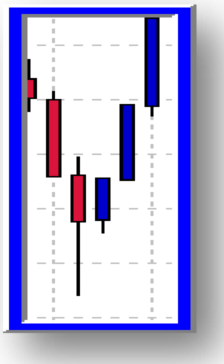
Bearish Spike



Bearish spike



Bearish Railway tracks



Bullish spike

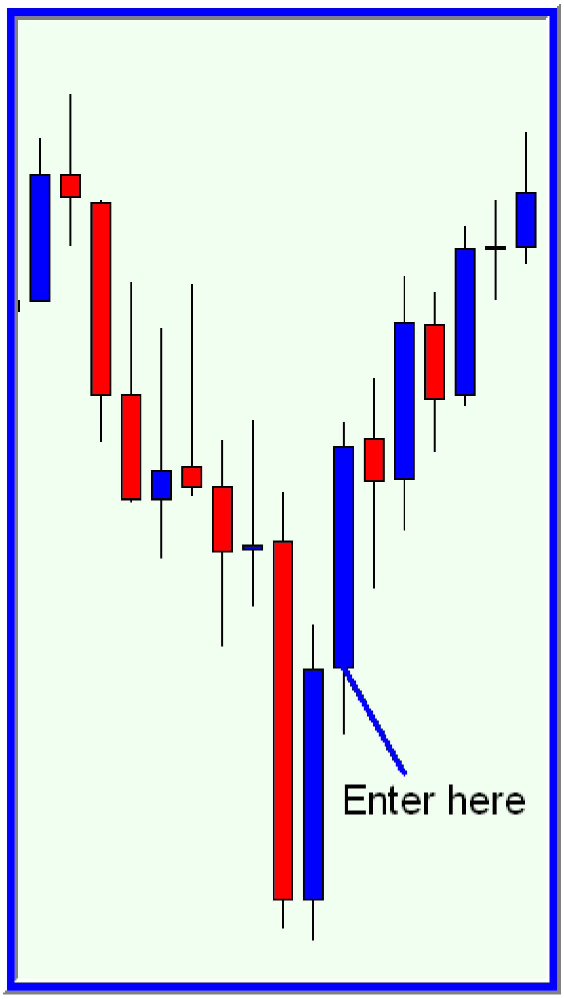
Simple-N-Easy Forex

HOME

7 Great Simple-N-Easy ways to find Turning Points in the Forex market



The Problem with trading candle sticks is that they are lagging signals. Their formation has to take place before you can trade them. This gives some pips back to the market and makes them somewhat less effective. Unlike the support and resistance and volume entries which can be made very close to the turning point.

They are however very powerful signals at the end of a trend and at the start of a new trend. You would enter on the close of the candle once the spike or railways tracks have been confirmed.

There will be a more detailed module on candle stick trading in the Simple-N-Easy series to be published at a later stage.

Basic technique on How to trade turning points using Candles

1. Set your charts to candle sticks on your selected timeframe (Can be used on all time frames)
2. Trade the reversal based on the close of the reversal candle once the reversal formation has been confirmed
3. Trade in a reasonable volatile time of day (See time of day module)
4. Enter stops and targets appropriate to your currency, timeframe and time of day
5. Amend this approach based on your own experience.

4 Using visible support and resistance

SUPPORT AND RESISTANCE

All competent and experienced Forex Traders I know use Support and Resistance concepts to trade, so this is a very important area. I have a particular favourite trading tool I use every day and that is non horizontal support and resistance often found using trendlines.

Resistance refers to the upper barrier that gets created by the BEARS defending the price from going higher.

Support refers to the lower barrier that gets created by the BULLS defending the price from going lower.

Non horizontal Support refers to the lower barrier that gets created by the BULLS who are slowly winning the battle and pushing the price higher.

Non horizontal Resistance refers to the upper barrier that gets created by the BEARS who are slowly winning the battle and pushing the price lower.

What happens in reality is that the BEARS and BULLS determine borders that they are willing to fight and die for every day. Therefore the charts become a bulls and bears battle ground map.

What some traders find tricky is that these borders can be both horizontal and non horizontal, as we in fact experience in between countries. As with countries that have drawn border lines, these border lines become embedded in the memory of the market participants. They remember the wars that were fought. They remember the casualties and victories. Even after many generations.

So expect some emotion when the price reaches these areas. Expect a fight. Our job is to determine who has the biggest army and the biggest guns. They are the ones that will win the battle and when they do, there will be a definite victory as evidenced by a big candle.

When the bulls win and move past the border, the BEARS often muster up the ability to fight back and chase them back to the breakout border. The original historic border will again be the place of a massive fight. That is why there is an old trading expression that “support becomes resistance” or “resistance becomes support”.

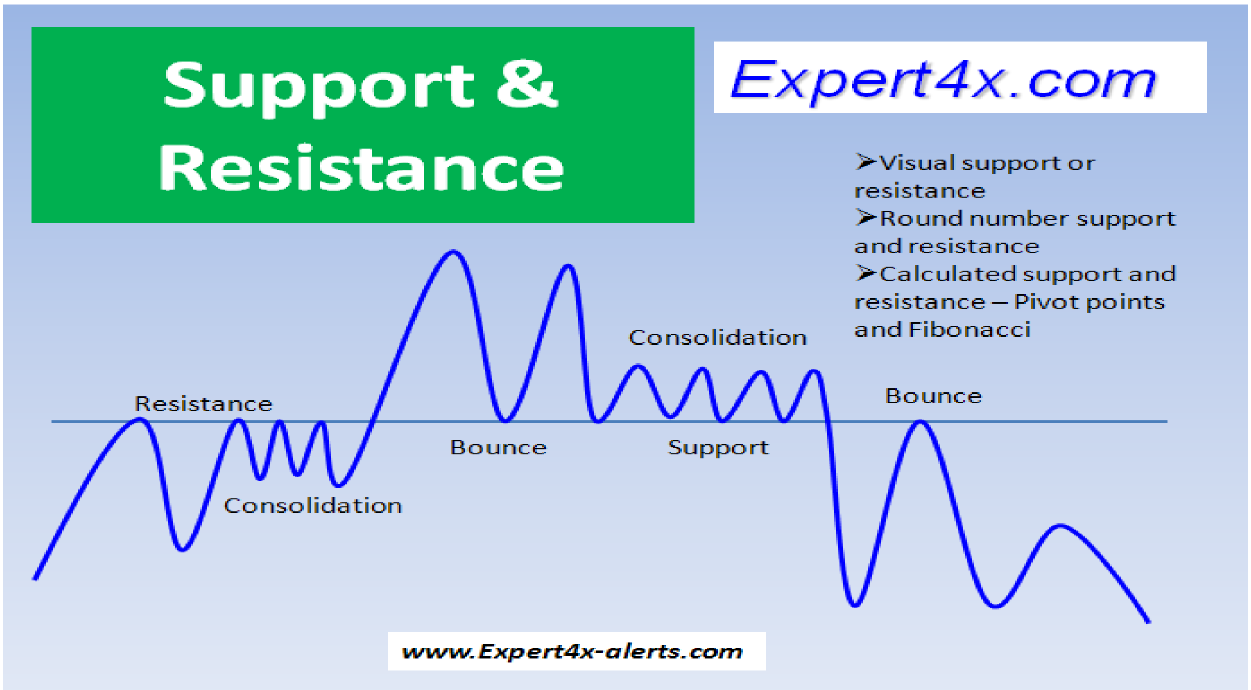
Now, these battlefields and borders are well marked on the trading maps to those who know how to find them and identify them. Especially those who think like the BULLS and the BEARS and remember to honour past battles. To those who do not honour history, it will look like just another desert on the map. Those who know the history of the past battles will know that the land is sacred and worth fighting for. Your job is to become an expert at history so that you can predict the place where the battle will take place. Once you have done that you need to read the signs that tell you which group will win the battle? When the battle is won there will be a long candle in most cases (not always).

7 Great Simple-N-Easy ways to find Turning Points in the Forex market

Support and resistance is a vast topic which will be covered in other modules in this Simple-N-Easy Forex series. We will not cover support and resistance in great detail but I will give you a few examples to illustrate the use of horizontal and non horizontal support and resistance.

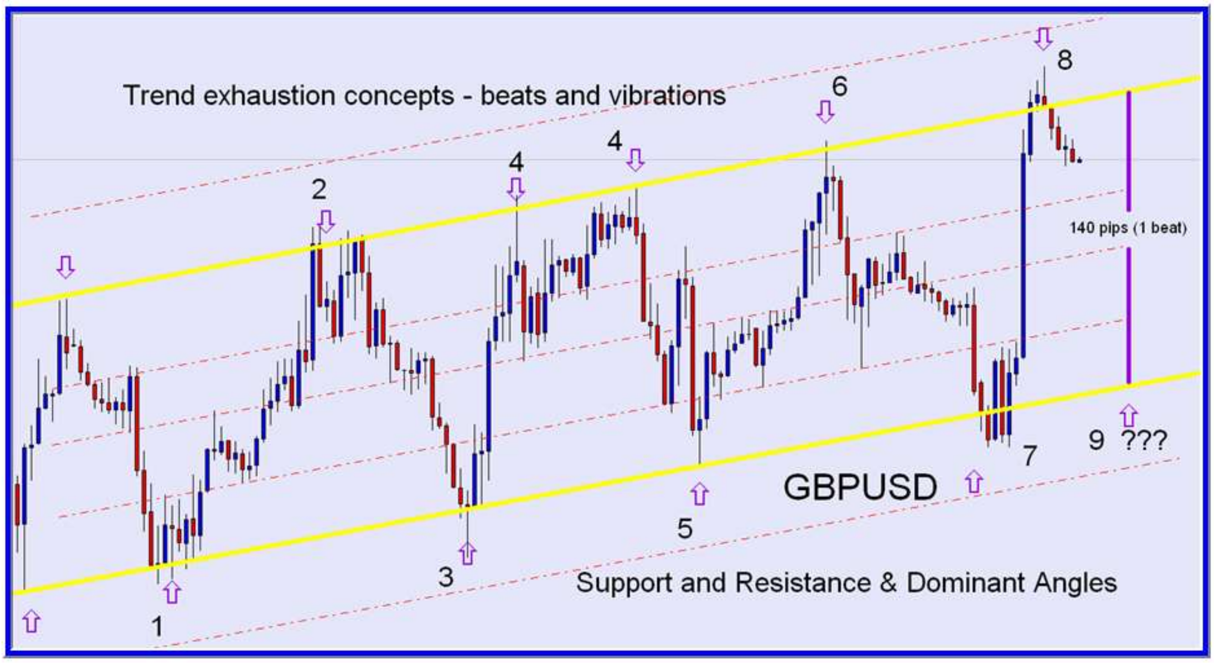
Some of these levels are visible price levels (e.g. historic support and resistance) whereas others are calculated levels (e.g. Fibonacci levels and Pivot Points)

The slide below shows how one price level can act as both support and resistance



7 Great Simple-N-Easy ways to find Turning Points in the Forex market

Non Horizontal support and resistance makes great entries for turning point trades.



Dominant angles

Certain angles on the downward and upward lines tend to repeat themselves over and over again (For years and years). This adds considerable weight to the use of non Horizontal support and resistance. What if non Horizontal support and resistance is also a channel line? What if that line is also a dominant angle line? All these factors add to the importance of a simple non Horizontal trendline.

The existence of these dominant angle lines is a major reason why non horizontal trendlines are much more reliable and consistent bouncing or turning point tools compared with other trading methods.

You will also find that long candles tend to bounce off or break through these dominant angle lines.

Finding these dominant angles is a case of trial and error starting with the daily chart of a currency. Start by drawing obvious support and resistance lines. As many as you can. After a while you will notice that many support and resistance lines are parallel to each other. This is the start of finding dominant angles.

Basic technique on How to trade turning points using Visible Support and resistance

1 Find strong support and resistance price levels based on the methods above.
2 Assume that the support or resistance will create a turning point
3 Place a pending order or market order to enter a reversal at the support and resistance level
4 Enter stops and targets appropriate to your currency, timeframe and time of day
5 Amend this approach based on your own experience.

6 Using invisible support and resistance as turning points

Fibonacci levels

There have been many, many books written on the Fibonacci retracement and extension percentages. They are used by so many other competent traders that one has to respect the principles and the support and resistance which occurs as result of the Fibonacci levels. Due to the general use of Fibonacci levels a self-fulfilling prophecy is created which turns that level into a support and resistance level.

There are a number of particular Fibonacci levels to watch out for and take seriously. This is when 2 separately calculated Fibonacci levels occur at the same level. This makes the level doubly as strong as a support or resistance level.

Below is a "Readers Digest" (highly summarized) version of Fibonacci trading.

The Fibonacci number sequence is created by adding the previous 2 numbers in a series to get the third number. So you start with 1. 1 + 0 = 1 (the second number in the series). 1 + 1 = 2 which gives you the third number. 1 + 2 = 3, 2 + 3 = 5, 3 + 5 = 8, 5+ 8 = 13 etc. So a series of number are obtained 0, 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89 etc.

Now the next step is to divide any number by the next e.g. 34 by 55 = 61.82% to give a ratio. Alternatively the second last number by the next e.g. 21 by 55 = 38.18%. These ratios are constant no matter how far up or down you go in the number series. These ratios are termed as the Fibonacci retracement ratios.

By dividing the next number by the previous number e.g. 55 by 34 = 161.76% you get the Fibonacci extension ratios which are also constant no matter how far up or down you go in the number series.

So when the market is trending (or if you can identify a clear reference leg in a market move) and starts retracing to the 38.18% and 61.82% levels, they will become support or resistance levels. The price is likely to move to 161.76% of the reference leg, as in this example.

7 Great Simple-N-Easy ways to find Turning Points in the Forex market

The chart shown above is an example of Fibonacci working on a monthly chart of the GBP. Fibonacci can be traded on short and long term charts and creates a continuous trading model as new reference legs are created on an ongoing basis.

Fibonacci levels provide turning point trade opportunities

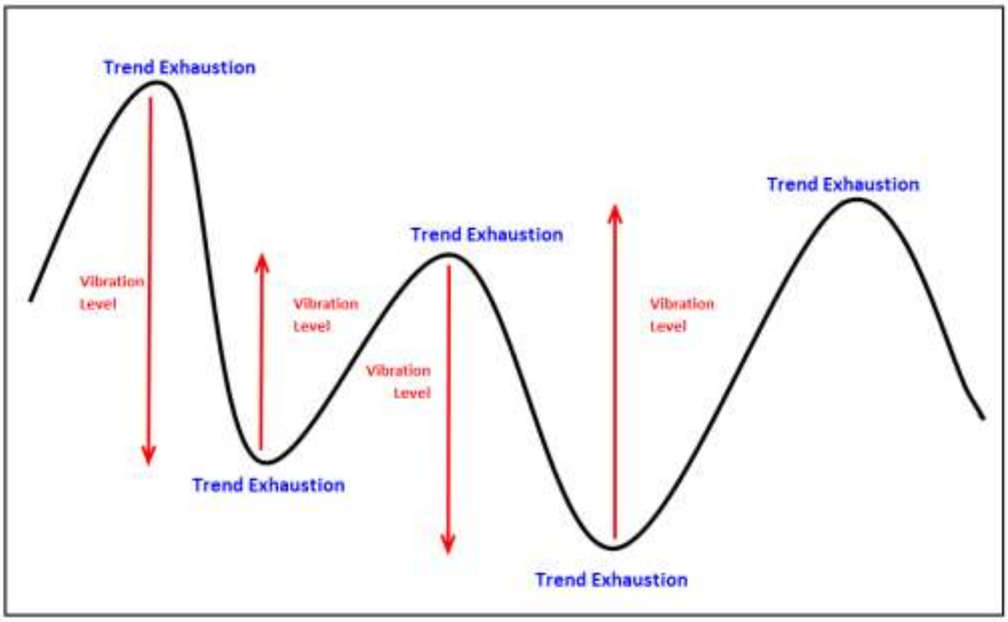
When non Horizontal, Horizontal and Fibonacci levels meet (confluence) they create turning point opportunities as shown in a recent trade example.

Basic technique on How to trade turning points using Invisible Support and resistance

1. Find strong retracement price levels based on the methods above.
2. Assume that the support or resistance will create a turning point
3. Place a pending order or market order to enter a reversal at the retracement level
4. Enter stops and targets appropriate to your currency, timeframe and time of day
5. Amend this approach based on your own experience.

6 Using exhaustion points as likely turning points.

The market moves in vibrations or beats. The turning points of these vibrations are caused by **trend exhaustion** levels allowing the price movement to stop and then to trade in the opposite direction. The distance between the major **turning points** (trend exhaustion levels) are referred to as the **vibration level**. This behaviour occurs on all charts – from the 1 minute to the monthly charts. On the longer term charts they are called "Beats."



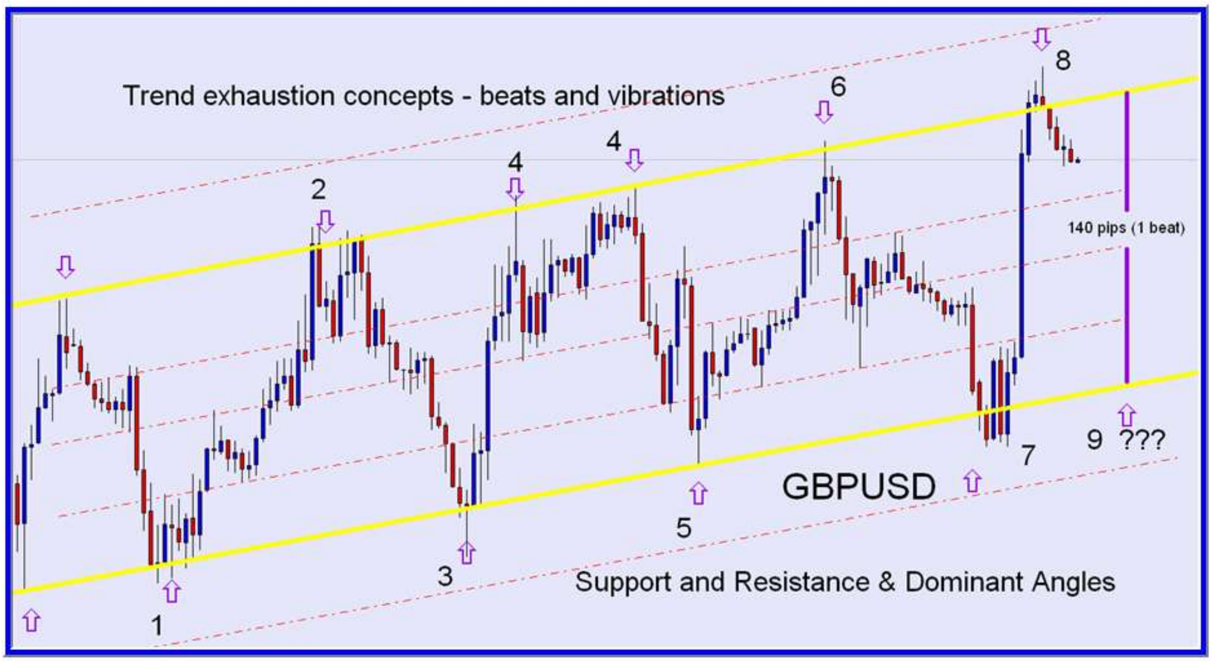
There are many ways that Forex traders try to determine the trend exhaustion points. Some of the most popular techniques and tools used are momentum indicators, support and resistance techniques, Elliott Waves, Fibonacci levels, Pivot levels and candle stick formations etc. They all work with a certain degree of success. Any currency has an hourly pulse or rhythm and a daily pulse or rhythm.

Any experienced Forex trader knows that the trading conditions in the US, Friday, Forex market at 9:00 New York are vastly different from the Asian, Tuesday, Forex market at 13:00 Tokyo when trading the Canadian Dollar. The differences in demand and supply and traded volumes of the Canadian Dollar can easily be seen in the volatility (trading range) of the currency and in volume information. You will see that we refer to these differences as the currency having a measurable high or low vibration rate at these different times.

7 Great Simple-N-Easy ways to find Turning Points in the Forex market

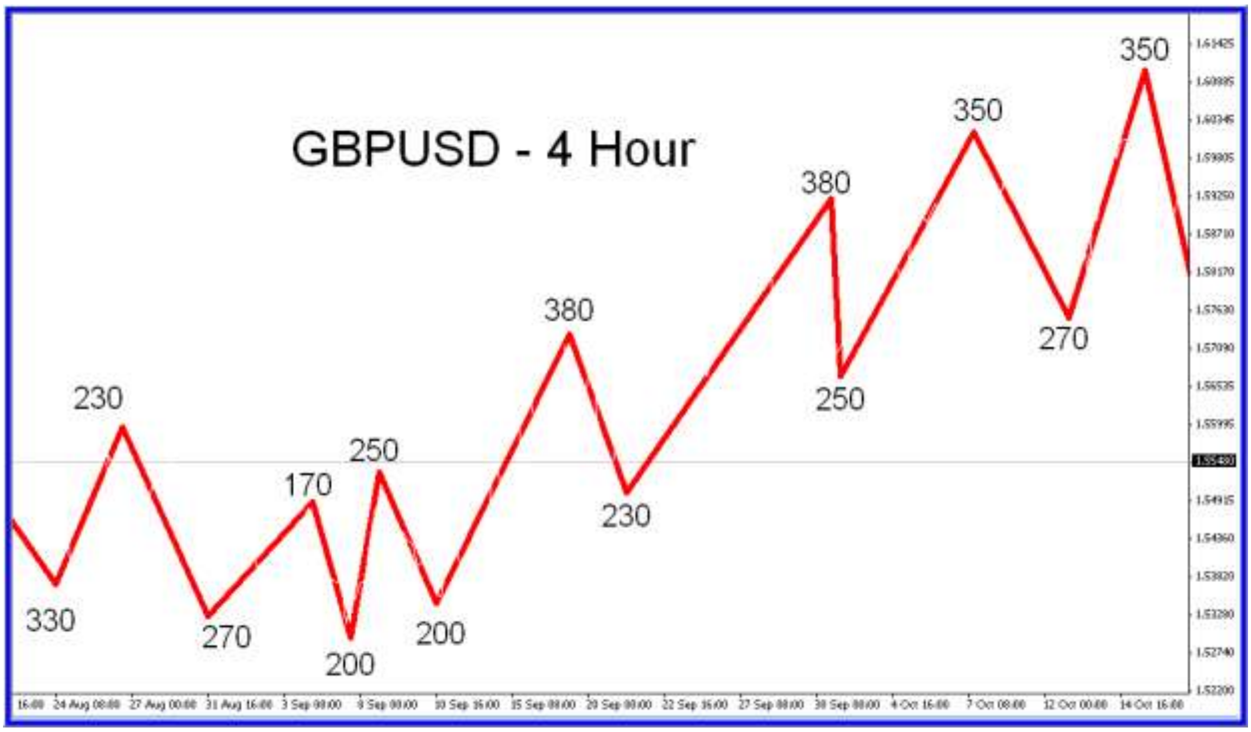
Let's assume that the normal currency vibration levels for a currency cross at a certain time of day is say 20 pips. It is therefore not unreasonable to anticipate a possible move in the opposite direction once the price has trended 20 pips. You are therefore giving the trade a high probability of success. At around the 20 pip level, the price is likely to become exhausted and will do a retracement or complete reversal.

On a larger timeframe the chart below shows a clear 140 beats for the GBPUSD during the period shown. So when there is a trend in the GBPUSD there is a good chance that the trend will is likely to be exhausted after 140 pips.



The ZigZag indicator can help towards measuring the beats of a currency

The ZigZag indicator can be found on the MetaTrader charting system by following this menu sequence > Insert > Indicator> Custom> ZigZag – You can use the default settings.



The philosophy is that when the price has moved by approximately the average beat or vibration it is ready for a retracement and these retracements can then be traded using your selected retracement trading method.

Please treat Beats or vibrations as guides when the price trend has a good chance of becoming exhausted and not as a precise entry point. They are best used in conjunction with other bounce methods such as support and resistance.

To see the hourly trading ranges for each currency, please click here> Ranges

This link is to externally supplied information and it's availability into the future can not be assured. You will see graphs giving the average hourly trading range (volatility) for each currency and also the daily trading range for each day of the week.

Basic technique on How to trade turning points using the Exhaustion Levels

1 Establish probable exhaustion levels based on the currency, timeframe and time of day you are trading.
2 Expect a turning point when the price has trended by the exhaustion distance in pips
3 Use any of the reversal methods discussed in this module to confirm and enter your transaction.
4 Enter stops and targets appropriate to your currency, timeframe and time of day
5 Amend this approach based on your own experience.

7 Time of day principles

The next group of orders we are going to cater for are the ones based on time of day factors. Time of day factors revolve around the economic announcement schedule and the Opening and Closures of financial markets in Asia, Europe and the US.

Please click on this link to download our module on time of day trading which is supported by 3 videos.

Below are some examples of turning points occurring when the major markets open and close.

Basic technique on How to trade Time of Day considerations when trading turning points

1. Be aware that certain times of day have a high probability for trend reversals as discussed in the Time of day module of this series.
2. Suspect a turning point when the time of day occurs
3. Use any of the reversal methods discussed in this module to confirm and enter your transaction.
4. Enter stops and targets appropriate to your currency, timeframe and time of day
5. Amend this approach based on your own experience.

Selecting a method

After the above review, you will have a good idea of the various ways of finding turning points in the Forex Market. Over your Forex trading career there is a very good chance that you will use most of these techniques when the circumstances are appropriate.

The 7 techniques were merely reviewed and introduced. The decision which method to use is dependent on the circumstances existing in the market at the time you are trading, your active deals and your personal circumstances as well as time availability and personal appeal to a trading approach.
